

***Request to Job Lifecycle
in a Concurrent Web
Server***

This diagram illustrates the general flow of how an HTTP request becomes a schedulable job in a concurrent web server. The **Dispatcher** component represents where our research intervention occurs, by comparing **FCFS** (First-Come-First-Served) versus **SFF** (Shortest-File-First) scheduling policies within the bounded buffer. Our research investigates how the choice of scheduling algorithm at Step 4 (Job Dispatch) impacts mean response time, fairness and system behavior under load.
